SUMMARY

As a Full-stack Developer with extensive experience in back-end engineering and a strong foundation in front-end technologies, I excel in tasks ranging from requirements analysis and project evaluation to implementation and debugging. I collaborate closely with fellow engineers to build robust applications, optimize performance, and enhance user engagement. I prioritize enhancing my communication and collaboration skills, recognizing their pivotal role in achieving success. My proven track record attests to my proficiency in these domains, and I am confident that my technical acumen and collaborative aptitude render me a valuable asset to any team.

EDUCATION

Master of Engineering in Software Engineering, Western University 2023 - 2024

Bachelor of Engineering in Computer Science, University of Kashmir 2017 - 2021

SKILLS

Languages: C, C++, Java, Python, JavaScript/Typescript
Frameworks: Django, Fast API, Flask, Spring, Express, React, Next.js, Angular, Vue
Databases: MySQL, PostgreSQL, MongoDB, Redis
Other Skills: Git, Docker, Docker Compose, GitHub Actions, AWS, GCP

EXPERIENCE

Full-stack Developer Apr 2024 - Present
RiskTec Systems, Toronto, ON

- Facilitated meetings with stakeholders to discuss the data model, ensuring the application's database strictly adhered to it.
- Developed backend APIs following best RESTful practices, and during PRs, ensured all developers adhered to these best practices.
- Implemented trade logic to ensure all relevant tables are correctly updated upon the execution of a ticket.
- Led the implementation of a comprehensive and dynamic mandate check logic for pre-trade tickets.

Back-end Engineer Jun 2022 - Mar 2023
GenioBITS Technologies, Pune, MH

- Enhanced the backtesting module by adding a feature to dynamically link different parameters using AND/OR grouping, making backtesting more comprehensive.
- Led the development of a strategy optimization module, allowing users to input ranges and options, generating all possible strategy combinations, and running backtests on them. This module also generates an Excel report with performance metrics and enables users to recreate any strategy.
- Set up Celery and Celery Beat for running asynchronous tasks and scheduled cron jobs.
- Identified and resolved blocking queries in the backtesting process, creating a custom caching solution that reduced backtesting time by 85%.
- Containerized the entire application using Docker, implementing Docker Compose to manage services for the backend, frontend, SQL database, Redis, and Nginx in the development environment.
- Integrated Zerodha's Breeze API to link user trading accounts and fetch real-time data using WebSockets.

- Developed functionality for running user-created strategies in real time, displaying a client-side graph that shows every trade being made for a security in real time.

PROJECTS

Online Book Store: ([Live Demo](#))

- Developed a feature-rich online bookstore using React, allowing users to access a public book list, register/log in, add books to their cart, checkout, create public/private book lists, search for books, and manage their book lists and cart.
- Implemented a separate admin section for administrative users, enabling them to activate/deactivate other users.
- Integrated the Google Books API to fetch and display book data.

ICICI Breeze Hub: ([Live Demo](#))

- Developed a market visualization application using the ICICI Breeze API for data fetching. Users can create accounts, add their Breeze account API key and secret, and follow the login flow to obtain their access token for personalized use.
- Implemented features allowing users to search for all available securities from Breeze, subscribe to any security, and view detailed graphs of subscribed instruments, including indicators like BB, MA, RSI, MACD, and volume.
- Utilized the Lightweight Charts library to create OHLC (Open, High, Low, Close) graphs.
- Deployed the application with a Django backend server and three Celery workers connected with a Redis broker for task management.
- Set up a separate Redis server as a cache, reducing data fetching time for graphs by 90%.

UserAuth (Demo): ([Live Demo](#))

- Built a comprehensive authentication system featuring email OTP for registration and the ability to send password reset emails with a password reset link.
- Implemented JWT authentication with refresh tokens that expire every 5 minutes, and client-side logic to automatically refresh the token if the API fails with a specific error code.

EXTRA-CURRICULAR & LEADERSHIP

- Contributed to Western University's AI Club on the ASL project, developing a CNN model for American Sign Language recognition.
- Led requirement analysis meetings with stakeholders at GenioBITS, coordinated and assigned tasks to the team to ensure client requirements were met.
